

Traffic Solutions Consultancy Services

Case Study: TfL Modernisation

Major Project

In 2006 Consultancy Services were awarded a place on TfL's ambitious program of traffic signal modernisation, refurbishing 300 life expired traffic signal sites a year.

The project brief included redesigning sites to the latest TfL standards, capitalising on new technologies and recalculating signal timings to reflect current traffic patterns. The works package included managing and coordinating the works on each site from design to implementation and commissioning.

Signals, civils and traffic management had to be organised to a tight schedule and around other planned works; liaising with the many relevant stakeholders and managing their expectations was key to the successful delivery.

Siemens is in the perfect position to offer a turn key approach to similar projects as we can design, supply, install and maintain traffic signal installations.

As Consultancy Services was new to working with TfL at the beginning of the program, we were initially given a works pack of 11 crossings and 4 junctions in the outer Borough's of London to test our abilities and competence.

Through a hard working and professional approach to the program Consultancy Services has built up excellent relationships with TfL leading to a threefold increase in the later works packages, 69 sites in total were awarded over a 3 year period. The later sites mostly comprised of inner Borough's of London including high profile sites such as Oxford Street and Piccadilly.
